

Green Space Quantity and Mental Health: Evidence on Gender Differences in Relationships and use of Work Status as a Proxy for Exposure

Dr Lynette Robertson,

Prof Catharine Ward Thompson, Prof Jenny Roe, Prof Peter Aspinall, Prof David Miller

Introduction

Methods

Results

- Part 1: Green space quantity (GSQ) effect sizes (Mental Health)
 - (i) gender differences
 - (ii) work status as a proxy for exposure
 - (iii) screening outliers and exceptional cases
- ~~Part 2: Factors underlying gender differences in GSQ-MH relationships~~

Discussion

Conclusions

Introduction

to outdoor environments

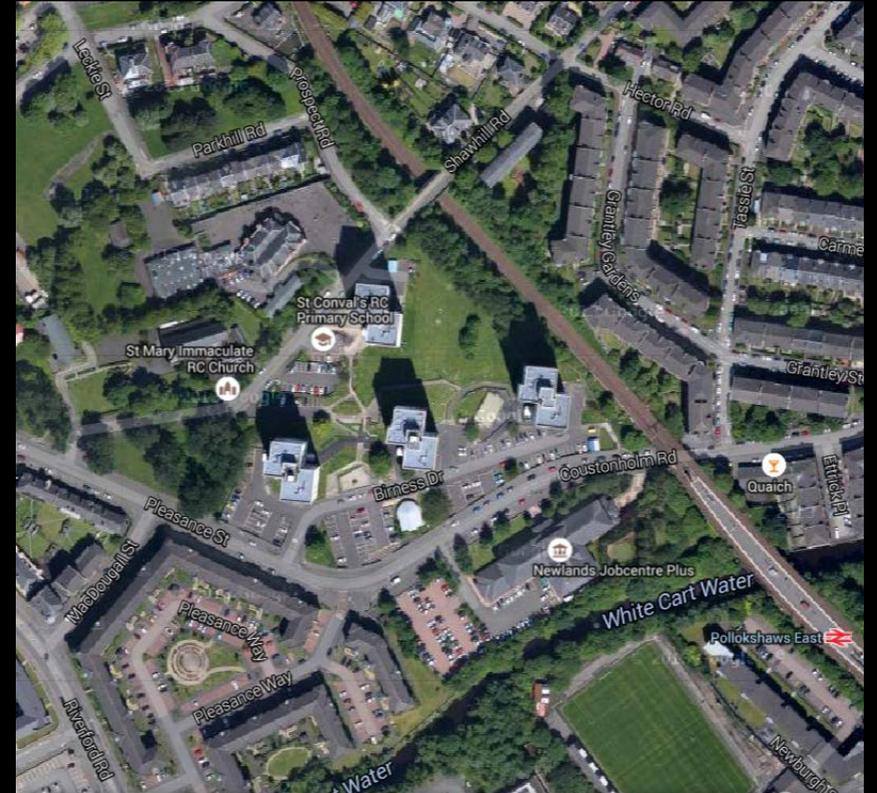

Research objectives

1. Examine **gender differences** in green space quantity (GSQ) – mental health relationships

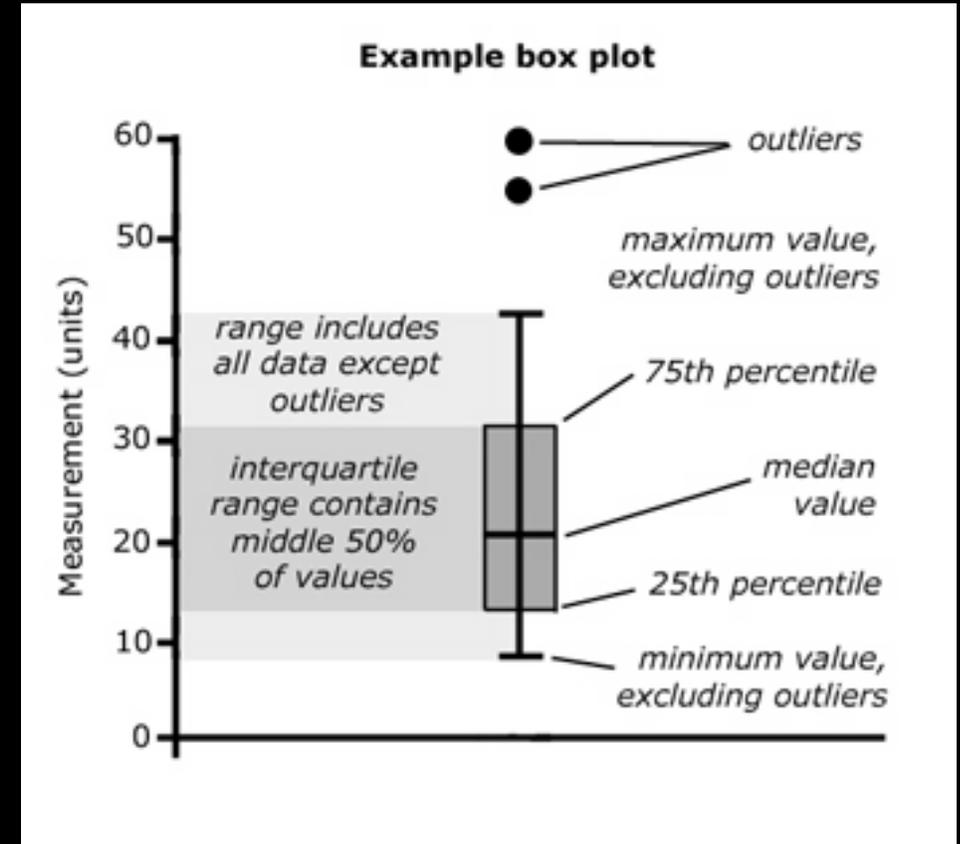

Research objectives

1. Examine **gender differences** in green space quantity (GSQ) – mental health relationships
2. Explore use of **work status** as a **simple proxy** for exposure to the local neighbourhood environment

Research objectives

1. Examine **gender differences** in green space quantity (GSQ) – mental health relationships
2. Explore use of **work status** as a **simple proxy for exposure** to the local neighbourhood environment
3. Examine the impact of removal of **outliers** and **exceptional cases** on findings

Poverty in Scotland at worst levels in 30 years: 1/3 population living in multiple deprivation (UK Poverty and Social Exclusion Survey 2013)

Methods

Research Design

Cross-sectional

CAPI survey

4 disadvantaged urban communities in Scotland (Edinburgh and Dundee)

Residents > 16 years

June 2010

N = 406

Measures

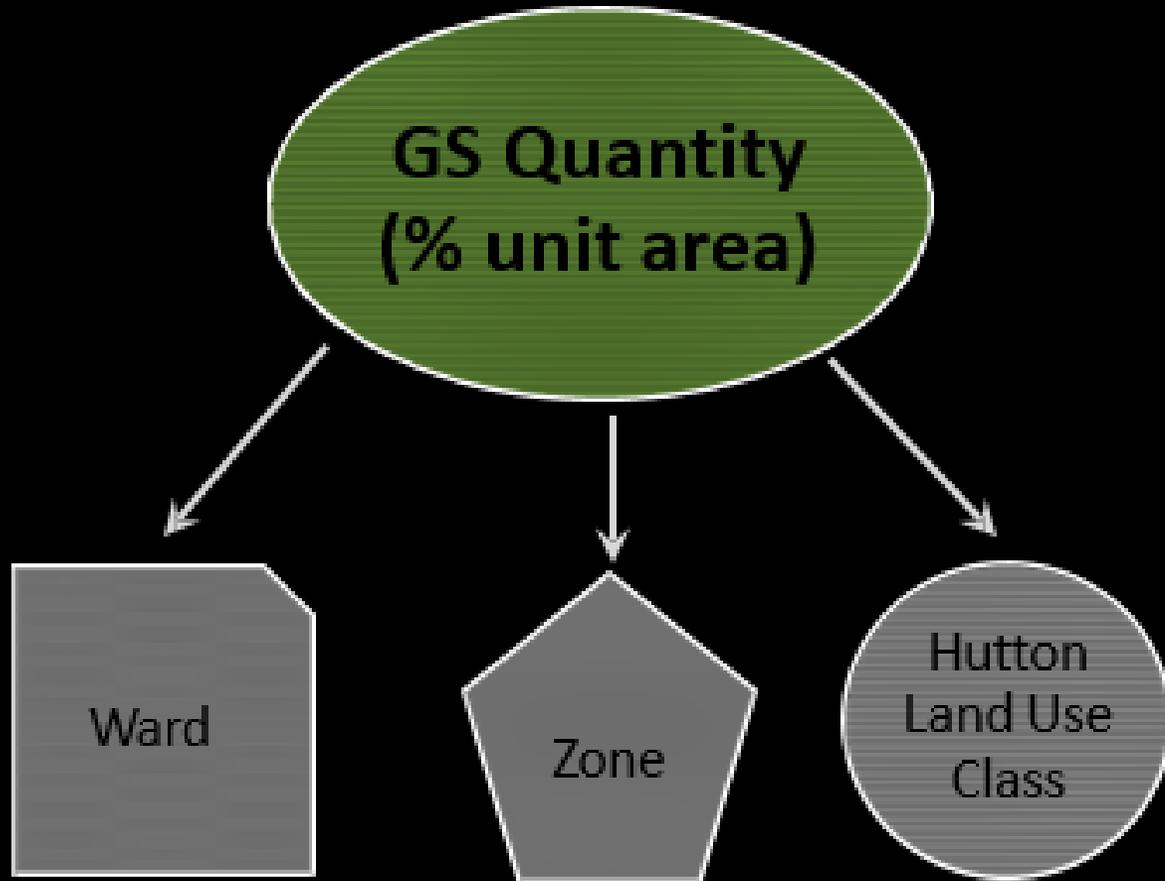

Health and Wellbeing

- **Perceived Stress Scale, PSS (Cohen & Williamson, 1988)**
- **Mental wellbeing, SWEMWBS (Steward-Brown et al., 2009)**
- Physical activity
- General Health
- Life Satisfaction

Green space: **objective** + subjective

- **quantity**
- quality
- accessibility
- usage

Measures: Green space quantity

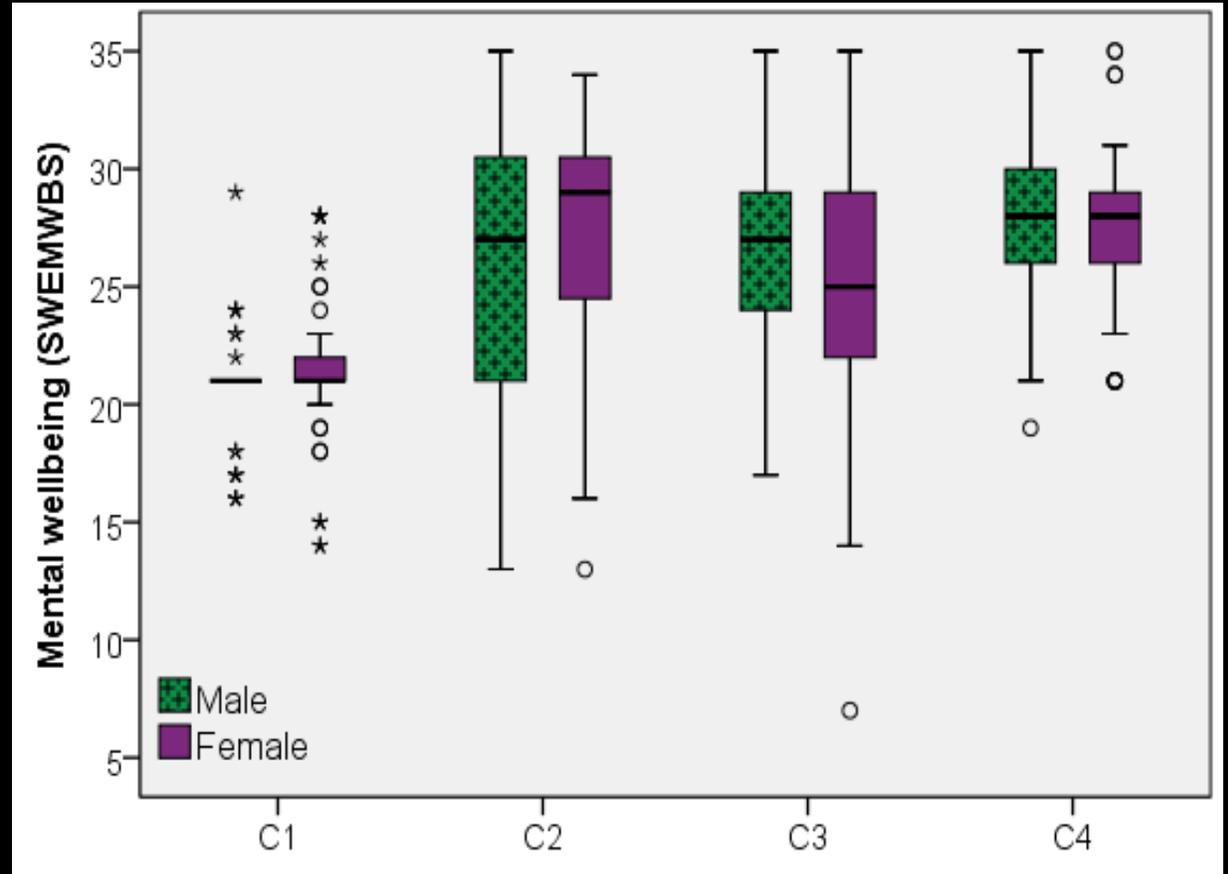

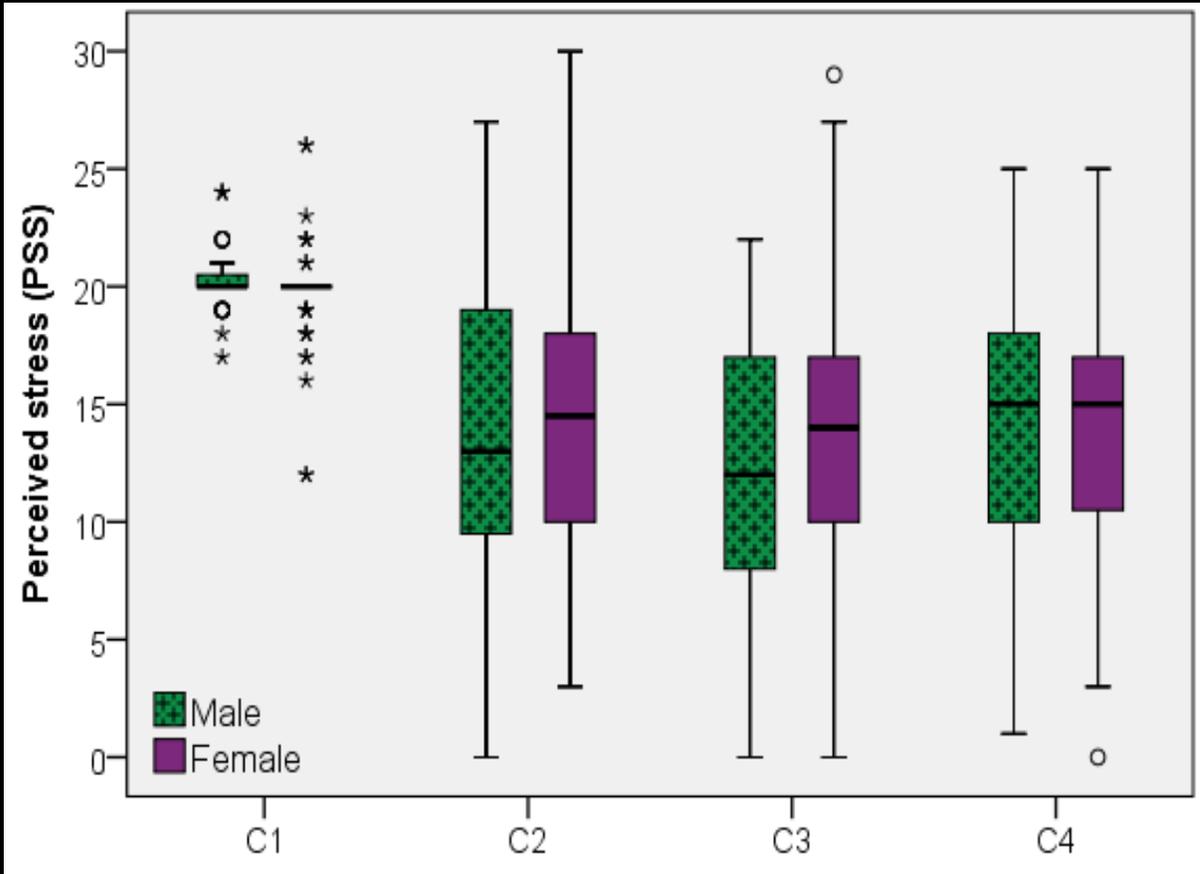

James Hutton Institute
'Land Use Class' (S Gov PAN65)

Public open space, gardens +
roadside trees and grass

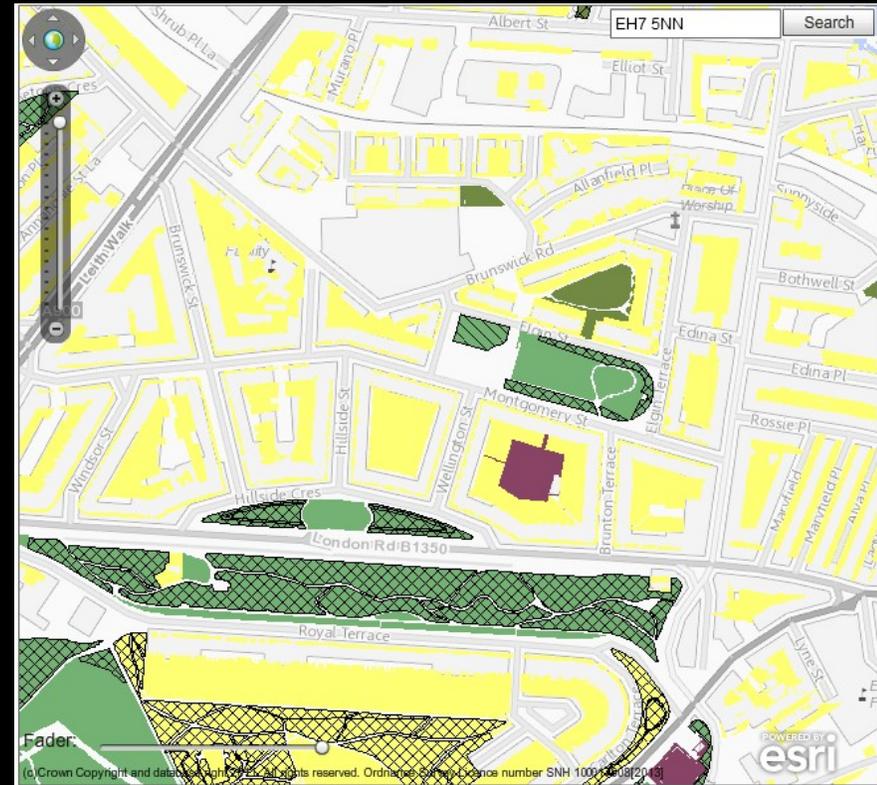

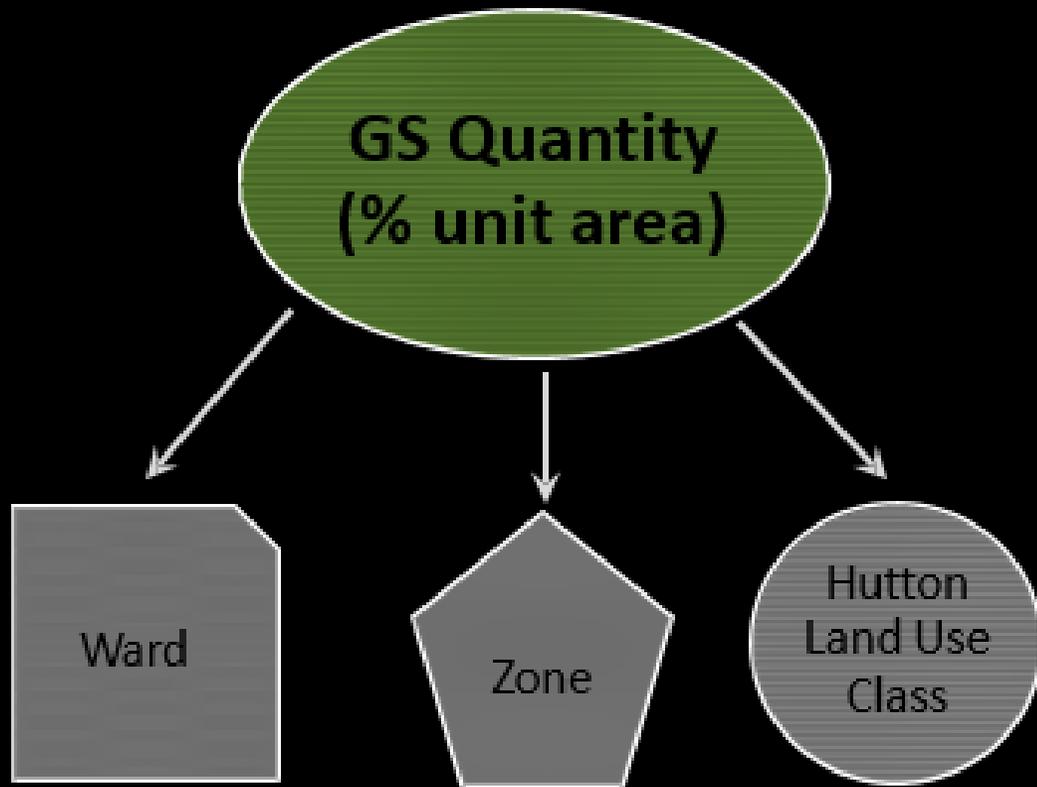

300m buffer around the home

Study sample

3 communities: n = 305

Study sample

HLUC Green space quantity: $n = 206$

Analysis

Hierarchical Multiple Linear Regression (MLR)

- Block 1: Age, Income Coping, Deprivation (Carstairs Index), Employment, Education, Life partner, Children
- Block 2: Physical activity
- Block 3: Green space quantity

+ Moderation by Gender

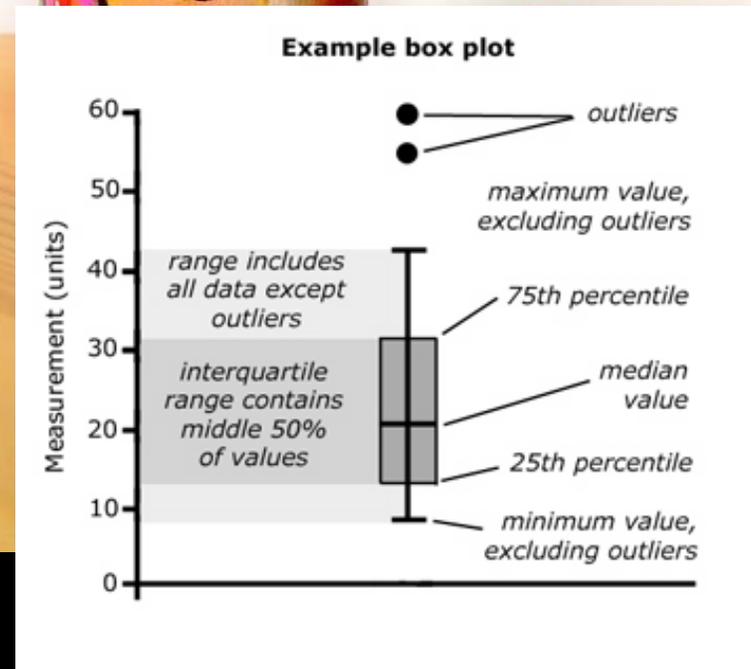

Regression analyses

1. Study sample (n = 206)
2. Individuals not in full time work:
'*Subgroup A*' (n = 147)
3. Individuals most likely to spend a greater proportion of their time at home, based on work status: '*Subgroup B*' (n = 68)
 - (i) looking after the home/family
 - (ii) retired
 - (iii) long term sick and disabled

Regression analyses

1. Study sample (n = 206)
2. Individuals not in full time work:
'*Subgroup A*' (n = 147)
3. Individuals most likely to spend a greater proportion of their time at home, based on work status: '*Subgroup B*' (n = 68)
 - (i) looking after the home/family
 - (ii) retired
 - (iii) long term sick and disabled

Regression analyses

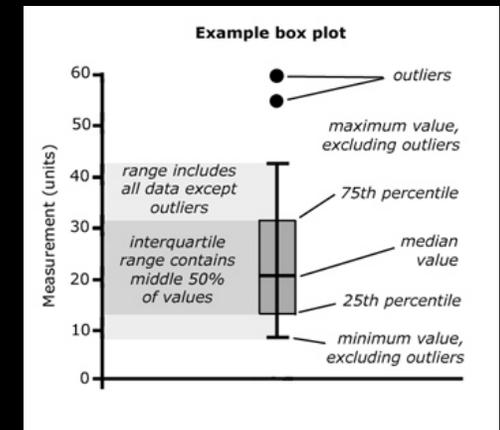

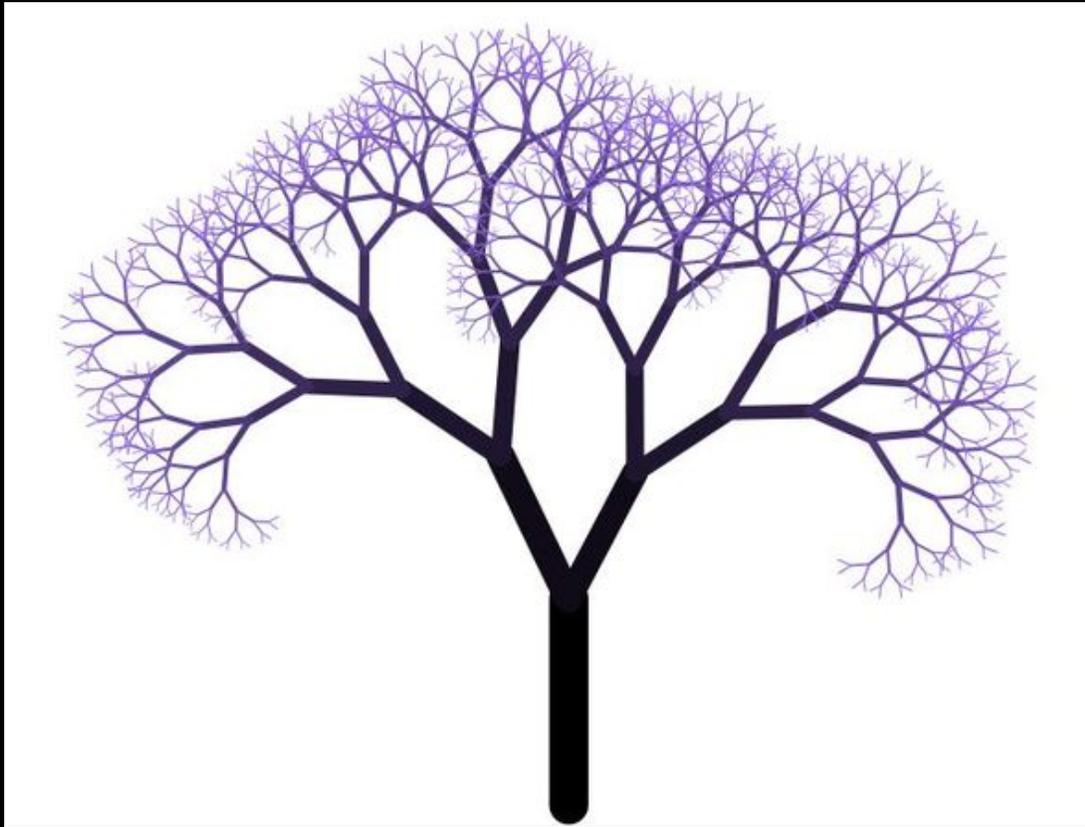

- (1) Study sample
- (2) Subgroup A: 'Not in full time work'
- (3) Subgroup B 'At home most'

By Gender (+ M&F combined)

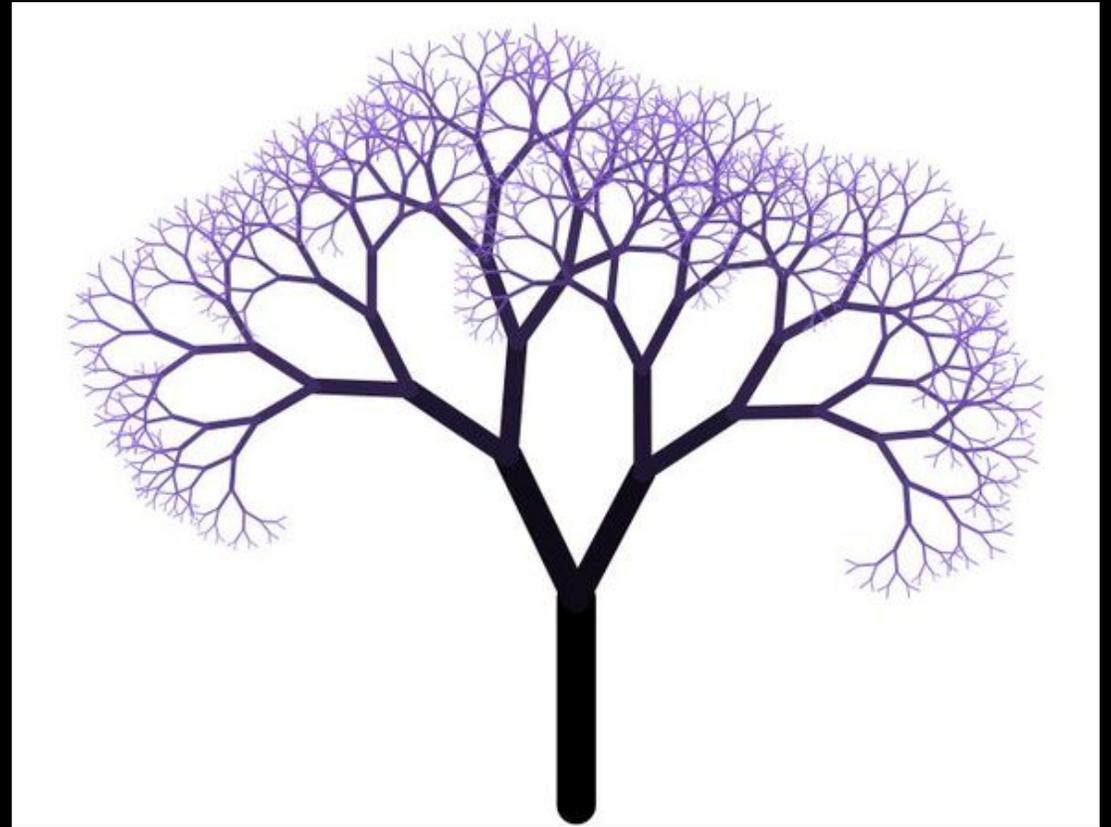

Exceptional adverse life conditions 'EALC' filter
(sample screened of (i) **outliers** + (ii) all individuals reporting a **sig. negative impact of recent life event**)

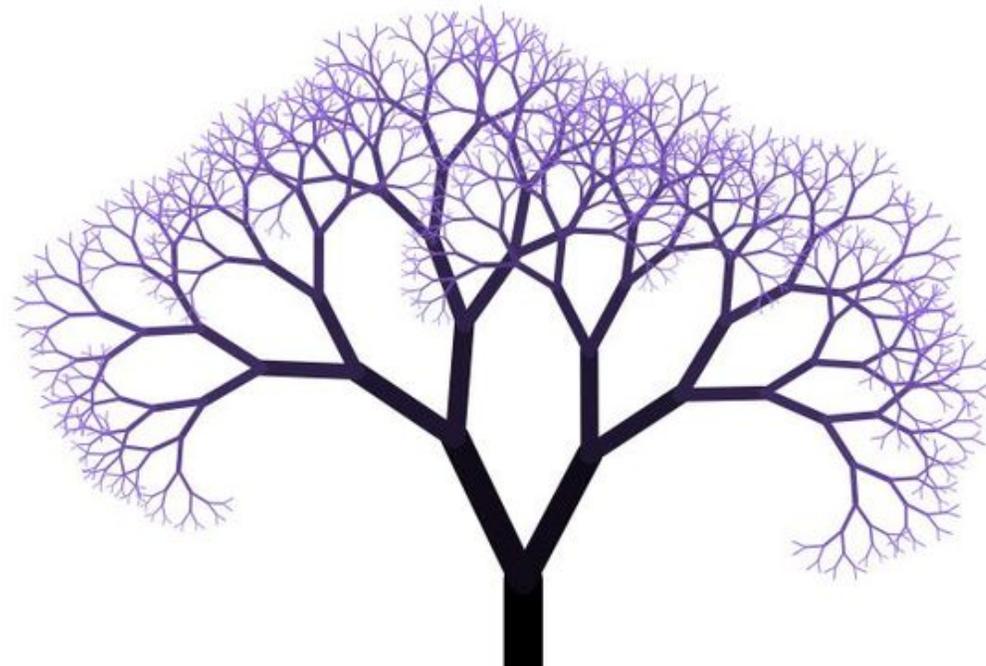

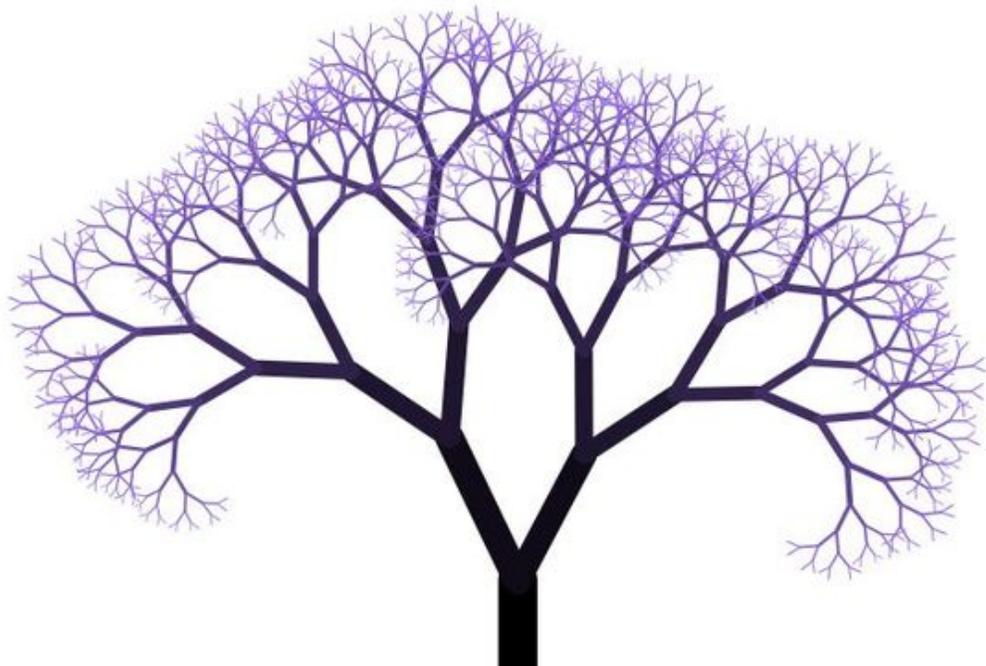

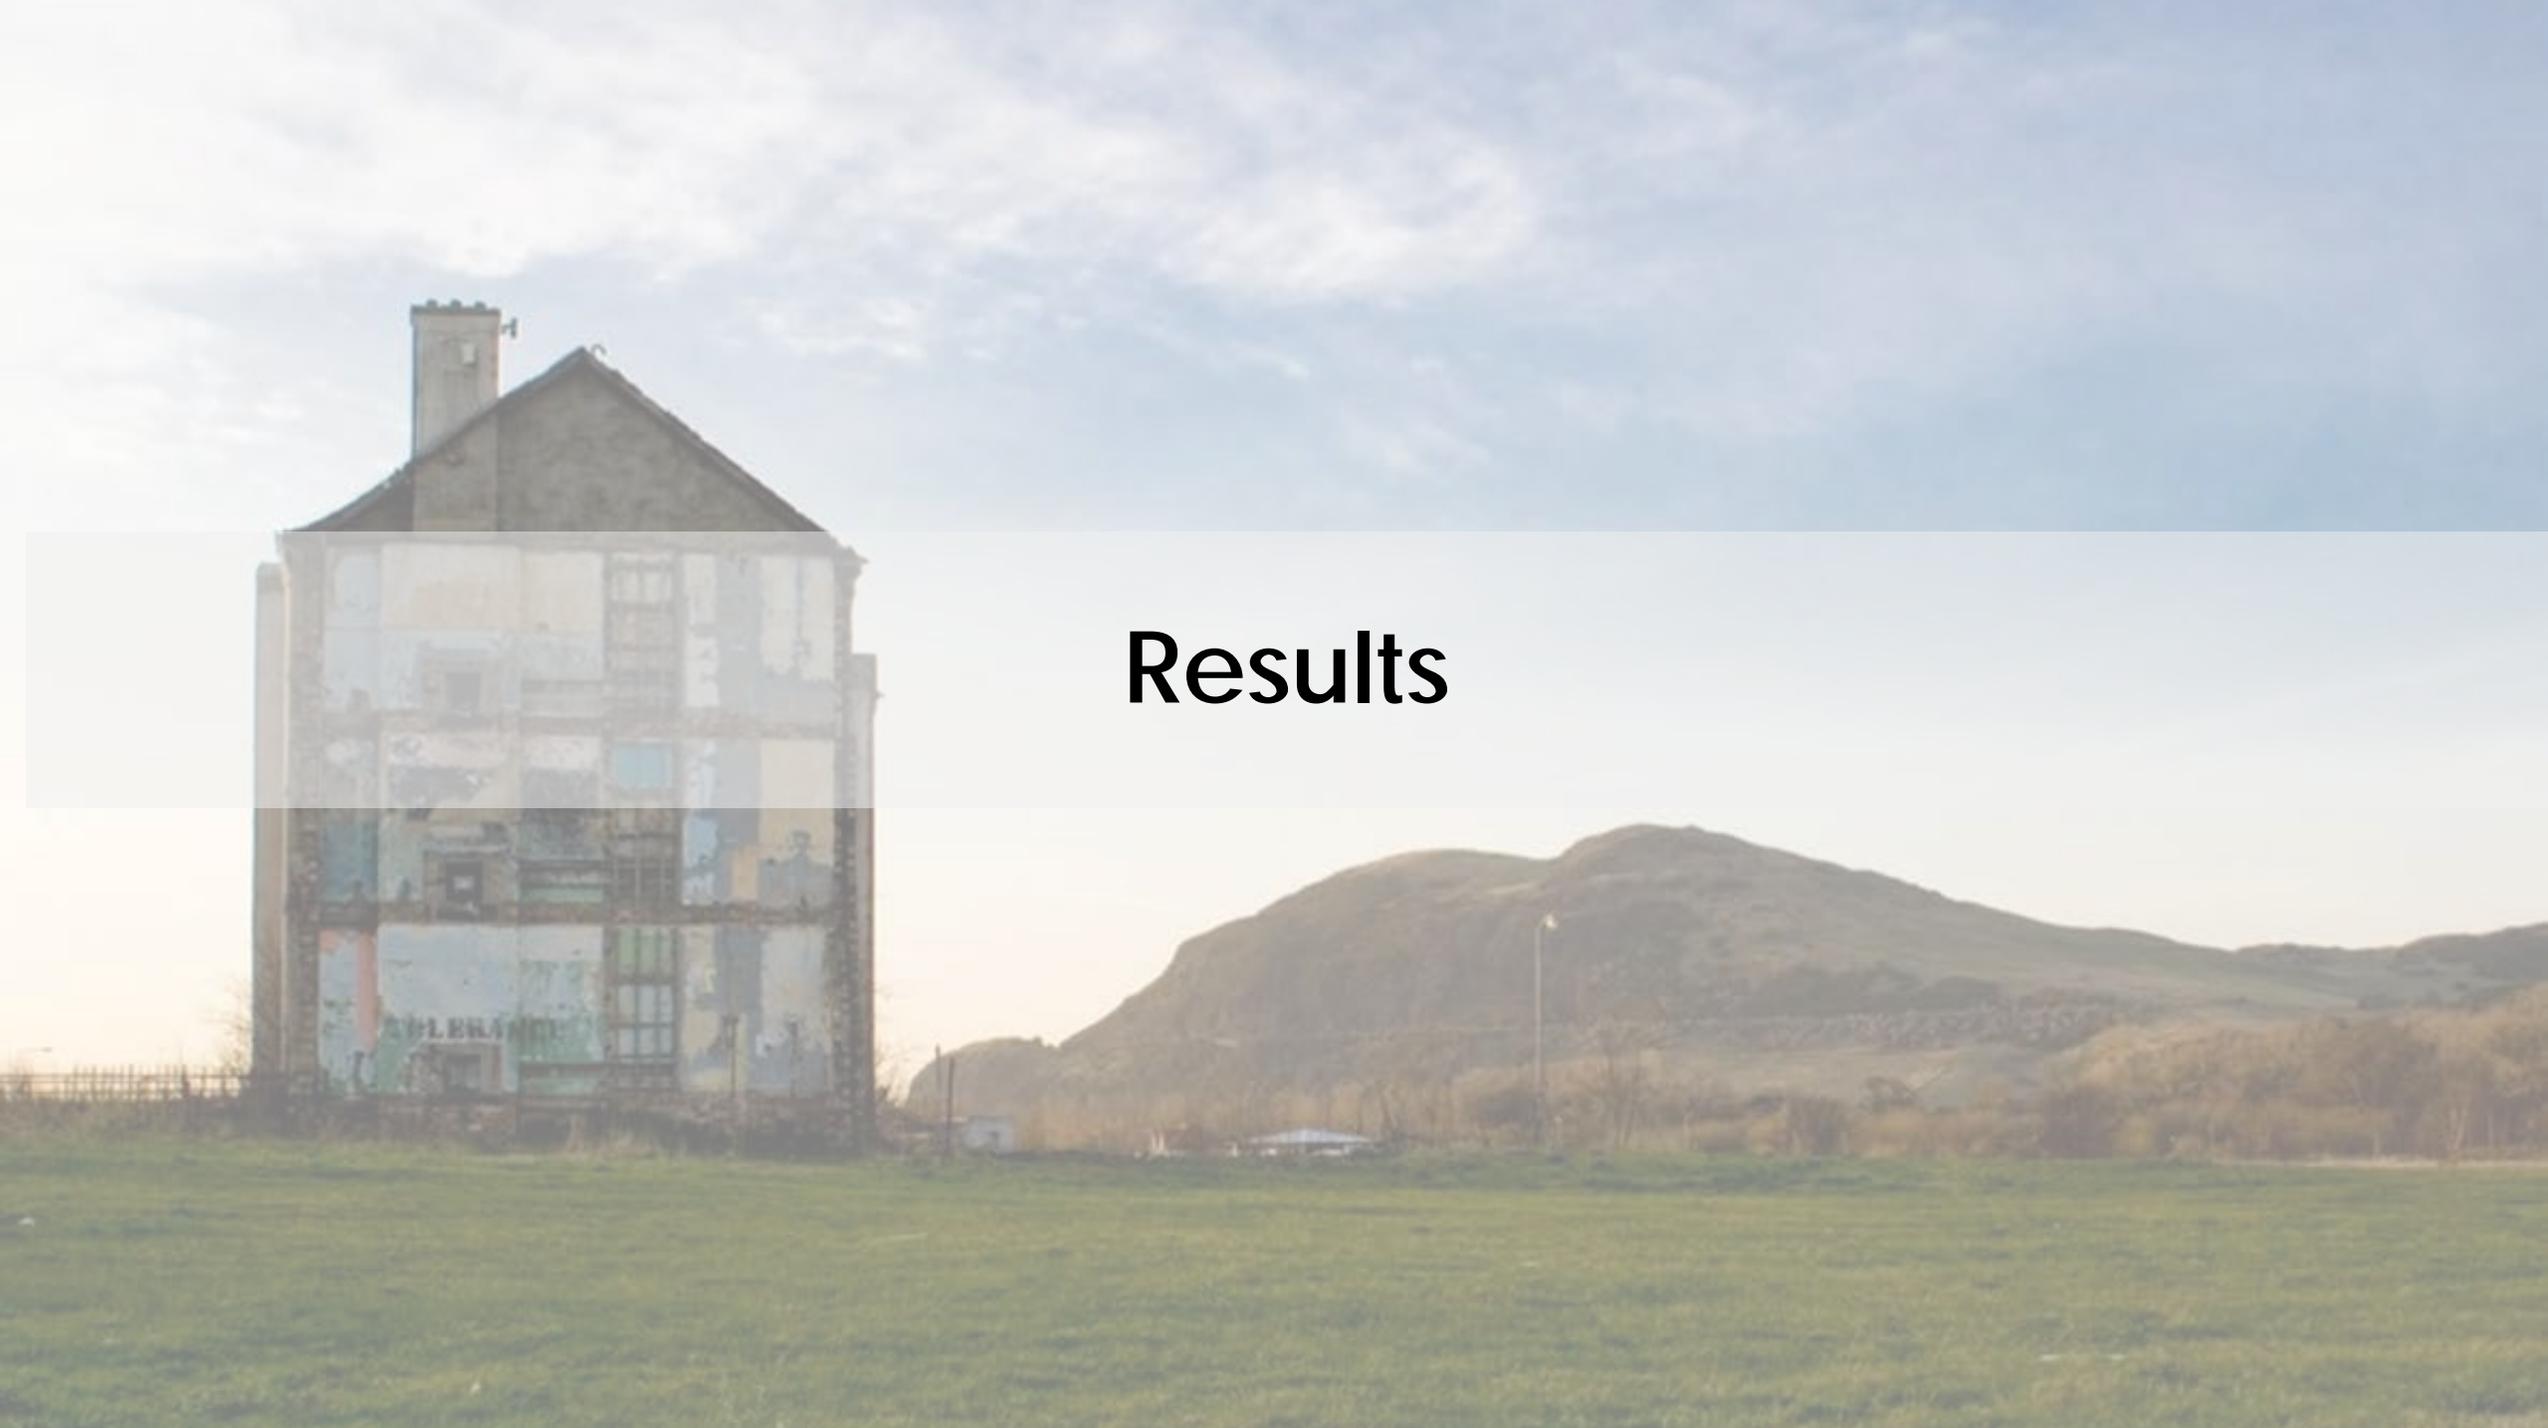

Perceived stress (PSS)

Mental wellbeing
(SWEMWBS)

A photograph of a tall, multi-story building under construction or renovation. The building has a gabled roof and a chimney on the left side. The facade is partially covered with scaffolding and various colored panels (blue, yellow, white). The building is situated in a green field. In the background, there is a large, rounded mountain under a cloudy sky. The word "Results" is overlaid in the center of the image.

Results

Sample characteristics

	Study sample			Subgroup A: Not in full time work (n = 147)		Subgroup B: At home most (n = 68)	
	All	Male	Female	Male	Female	Male	Female
n (%)	206 (100)	85 (41)	121 (59)	52 (35)	95 (65)	22 (32)	44 (65)
Age [n = 205]							
mean (SD)	44 (17)	46 (17)	43 (17)	50 (18)	44 (18)	65 (11)	51 (19)
min, max	16, 82	16, 82	16, 74	16, 82	16, 74	28, 82	17, 74
Work status (n,%)							
Working full-time	29	39	21				
Working part-time	16	4	25	6	32		
Job seeking	19	27	14	44	18		
In education (full or part-time)	2	2	2	4	3		
Looking after home/family	9	0	15	0	19	0	41
Sick or disabled	4	6	3	9	4	23	9
Retired	19	20	18	33	23	77	50
Unknown	2	2	<1	4	1		

Ethnicity:

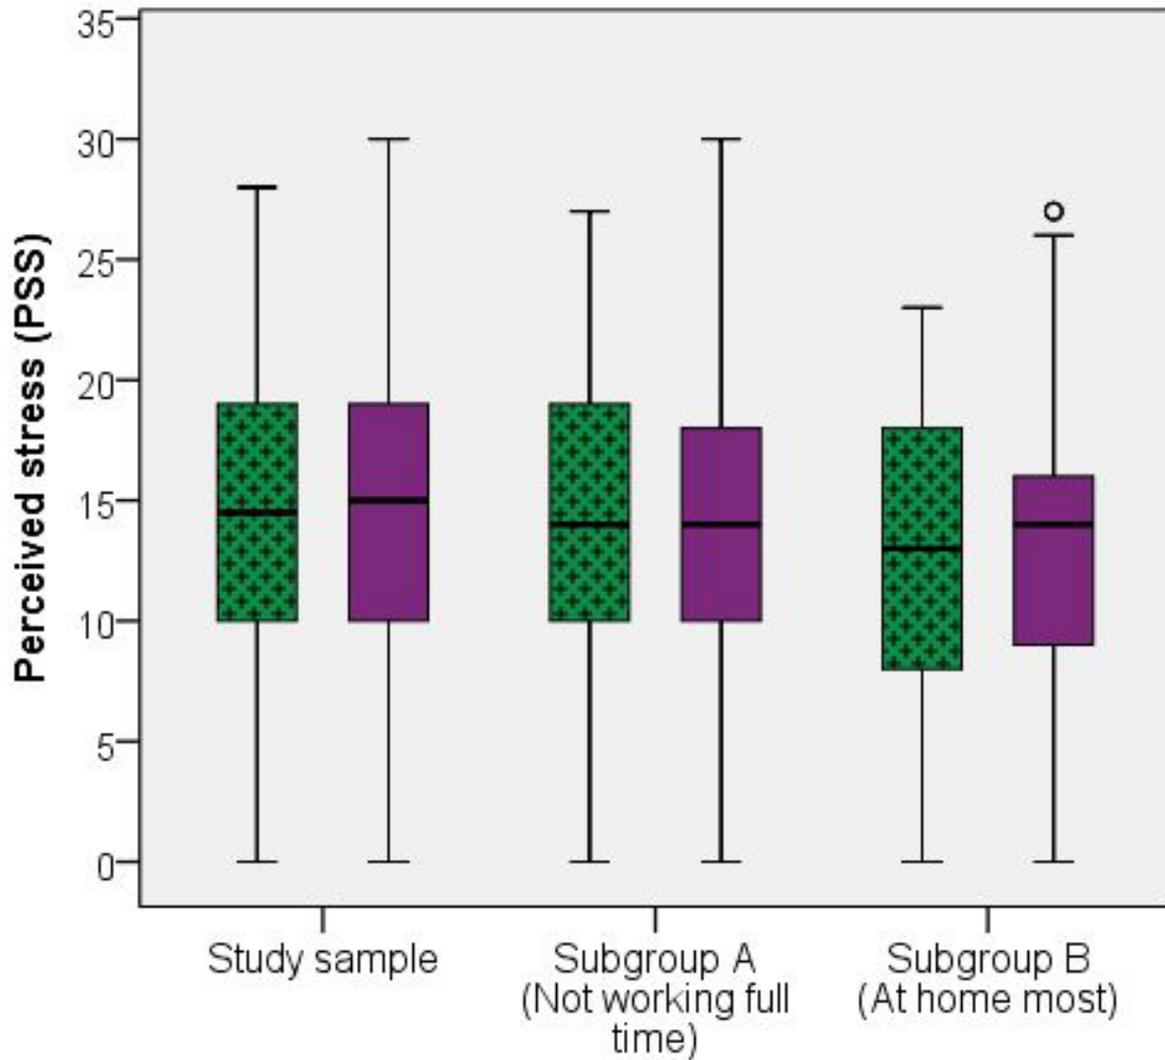

White

Scottish 96%

Other UK 1.6%

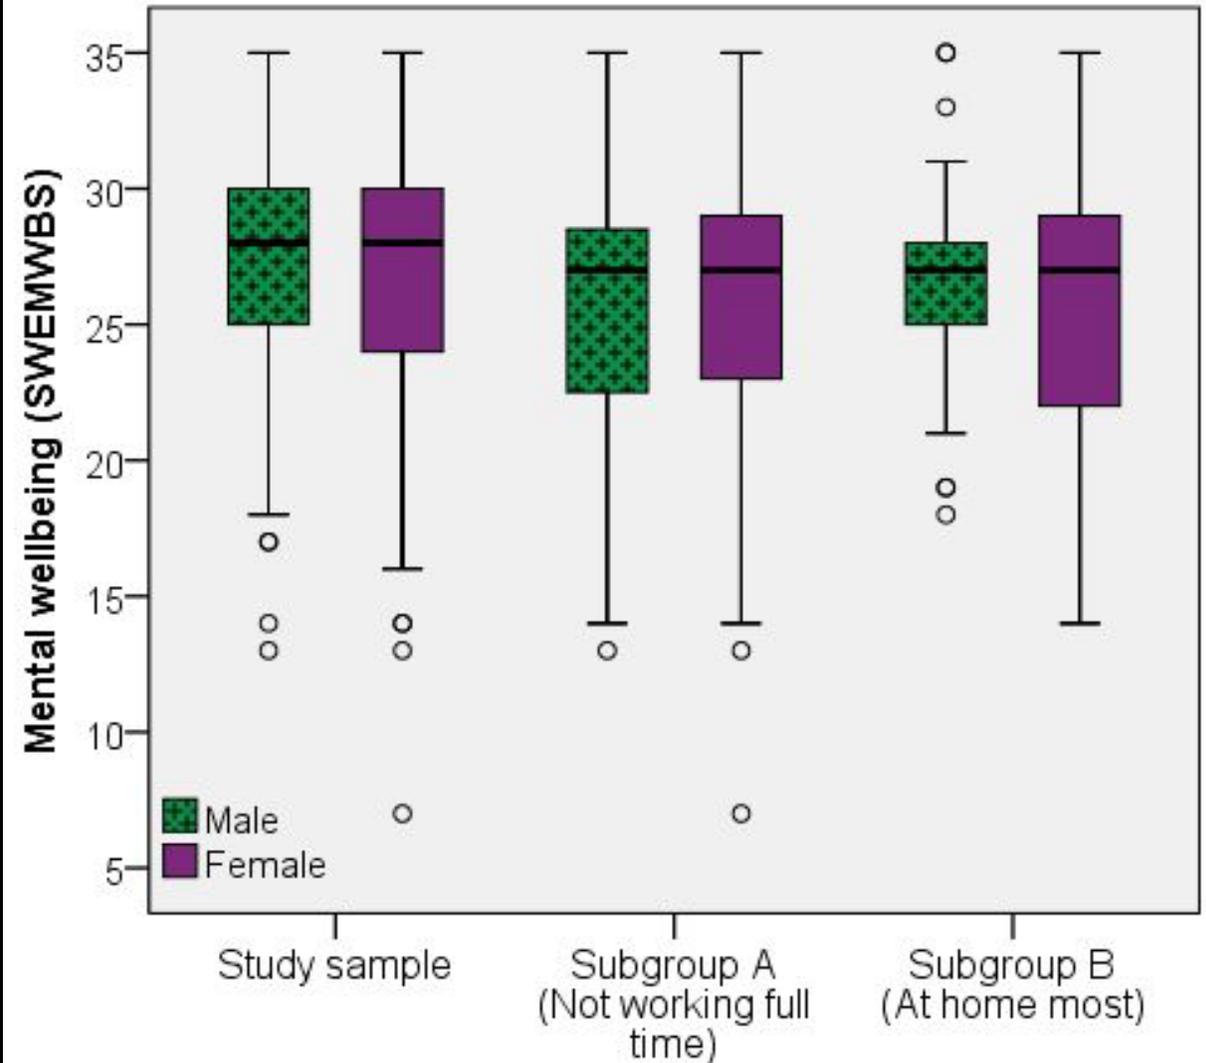

Non-UK 2.3%

All participants (no filter)

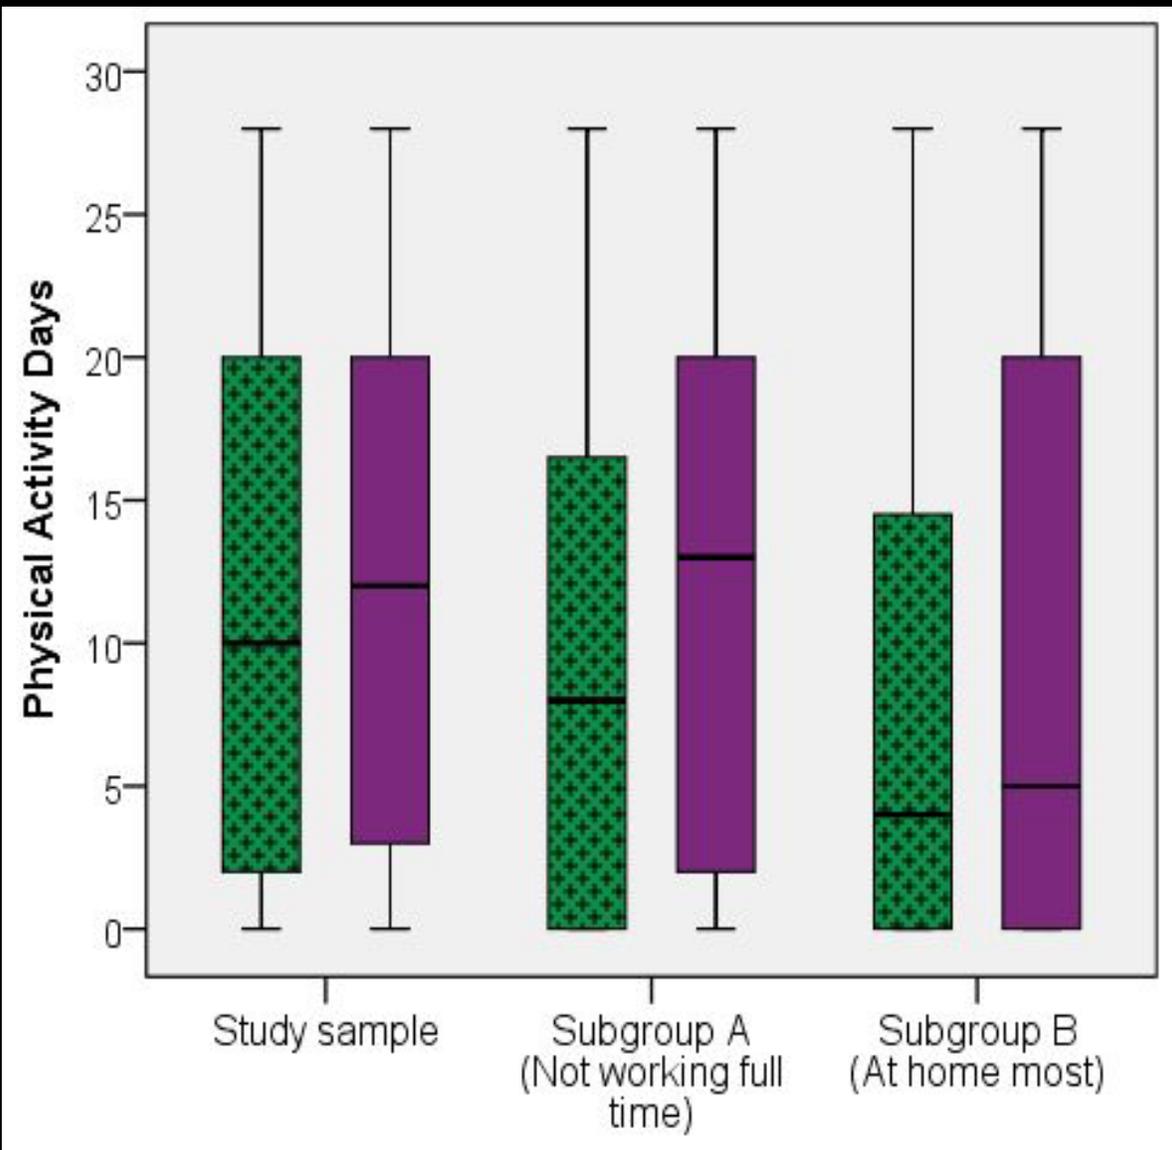

Perceived stress (PSS): mean = 13.9
(SD = 6.3), males = 13.1, females = 14.4

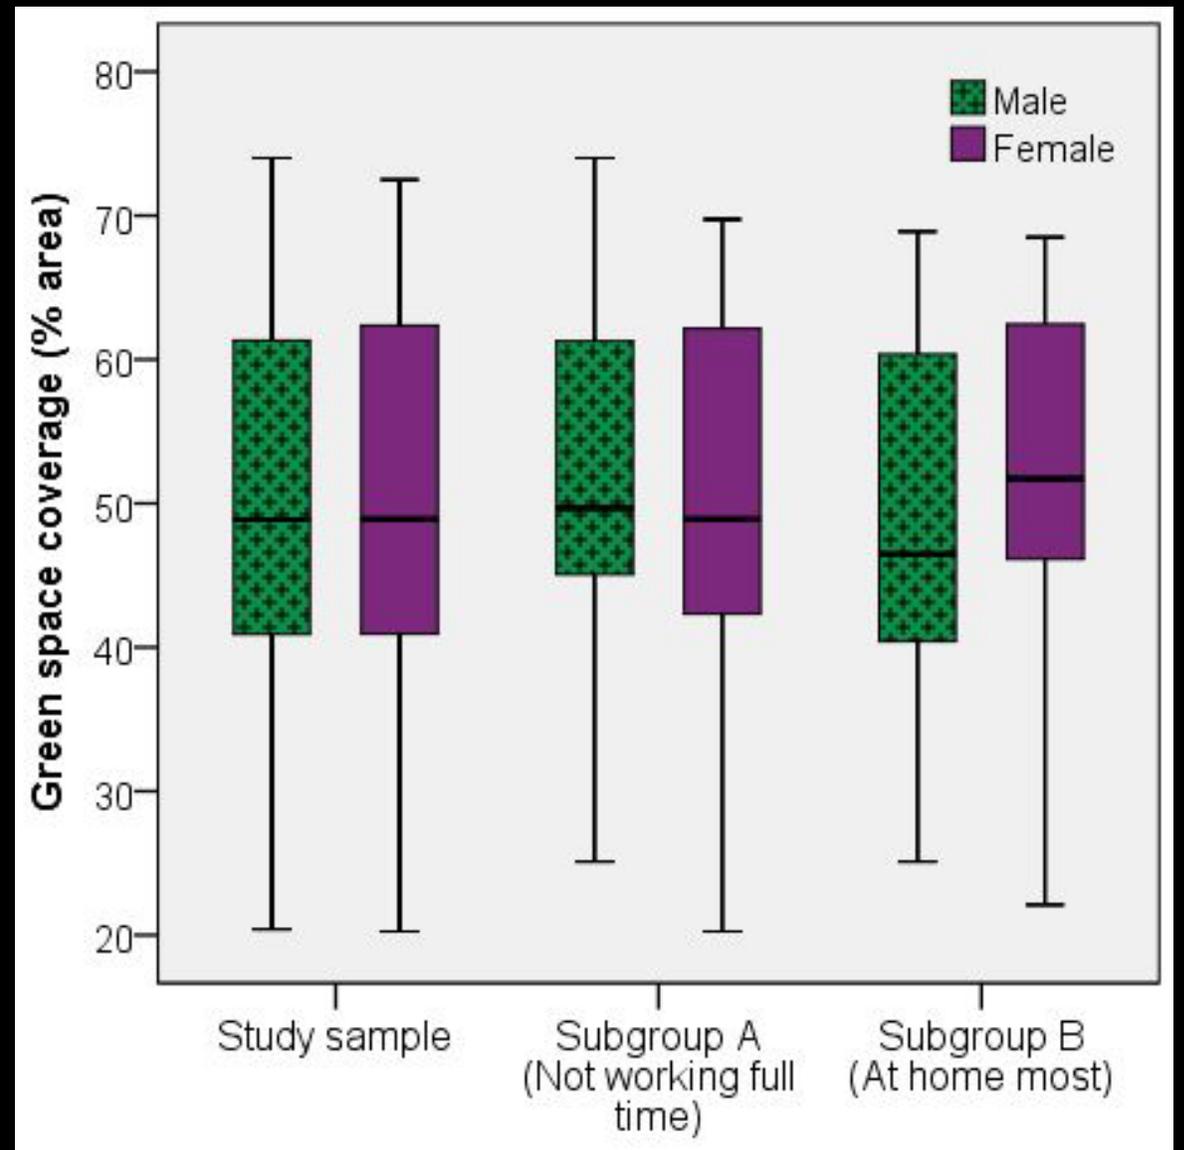

All Participants (no filter)

Mental wellbeing (SWEMWBS): median = 28 (IQR = 5), males = 28, females = 27

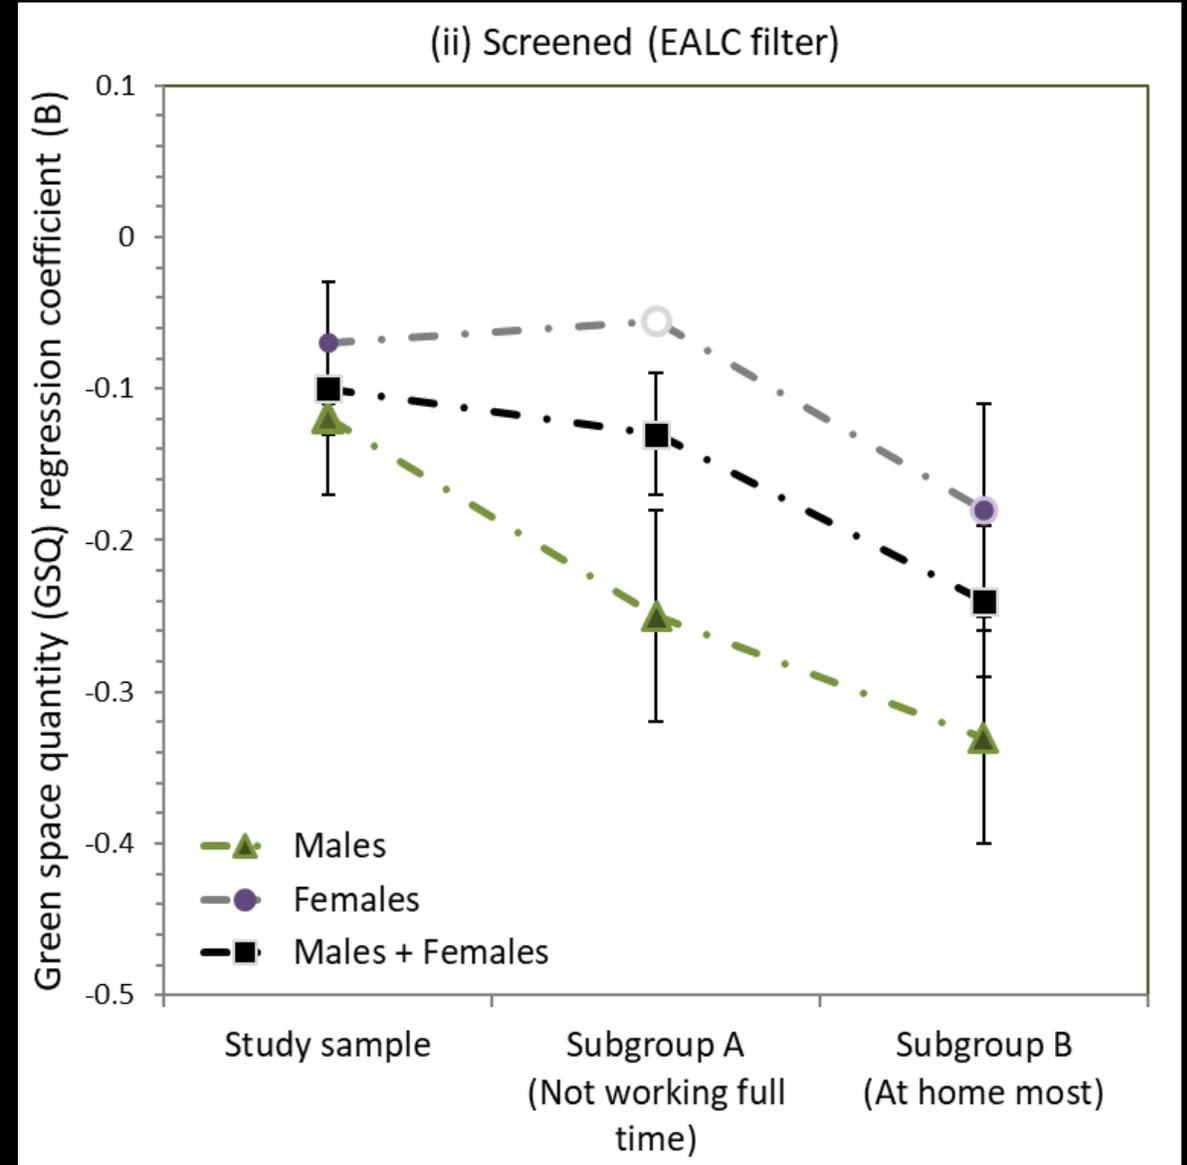

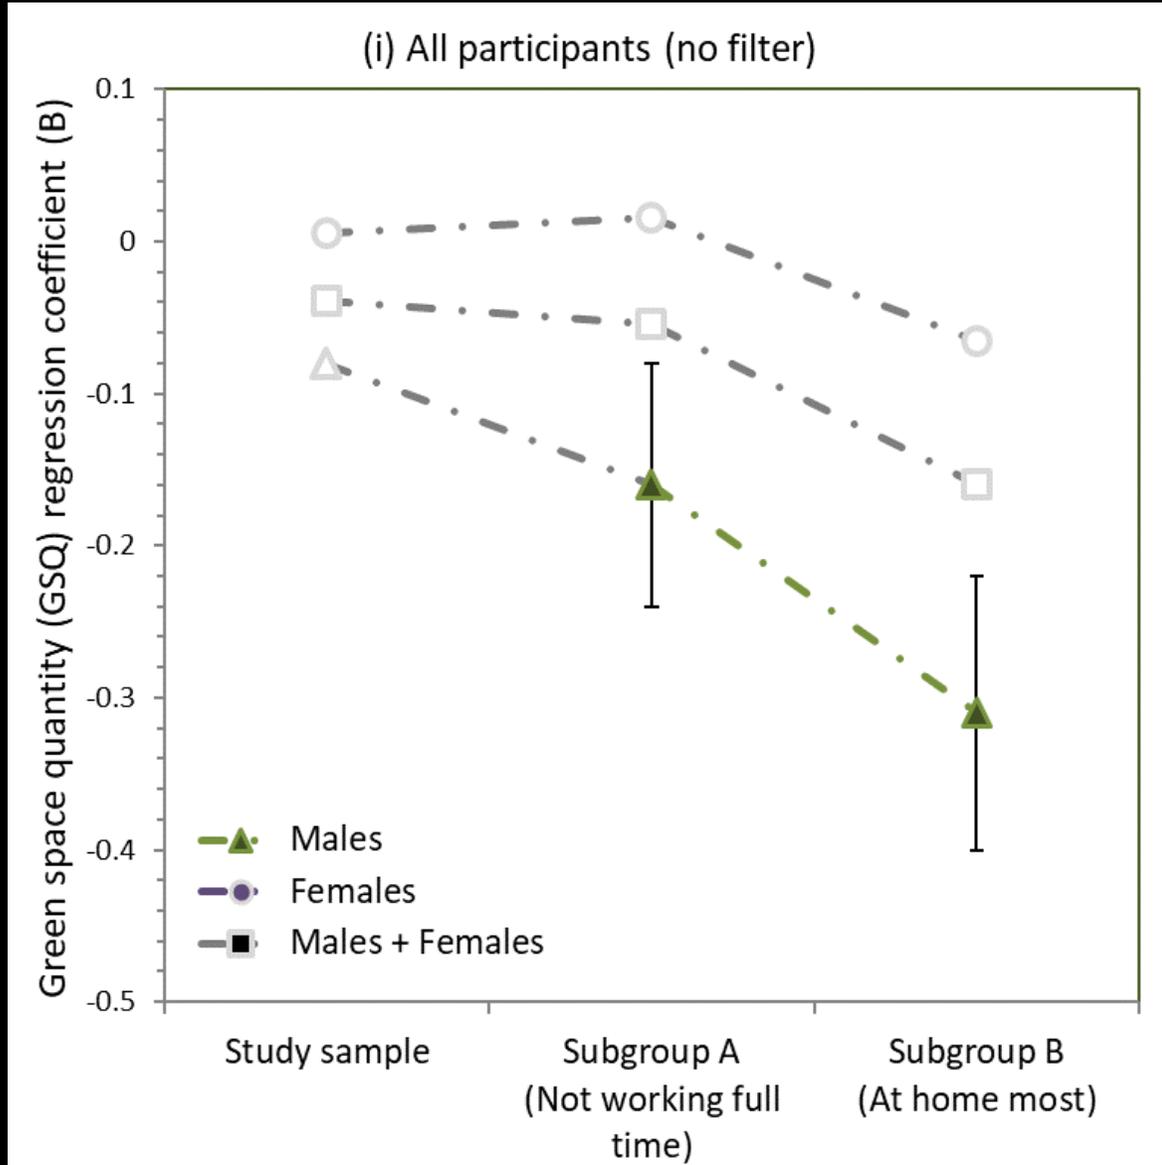

Physical activity: median = 14 (IQR = 15), males = 12, females = 15

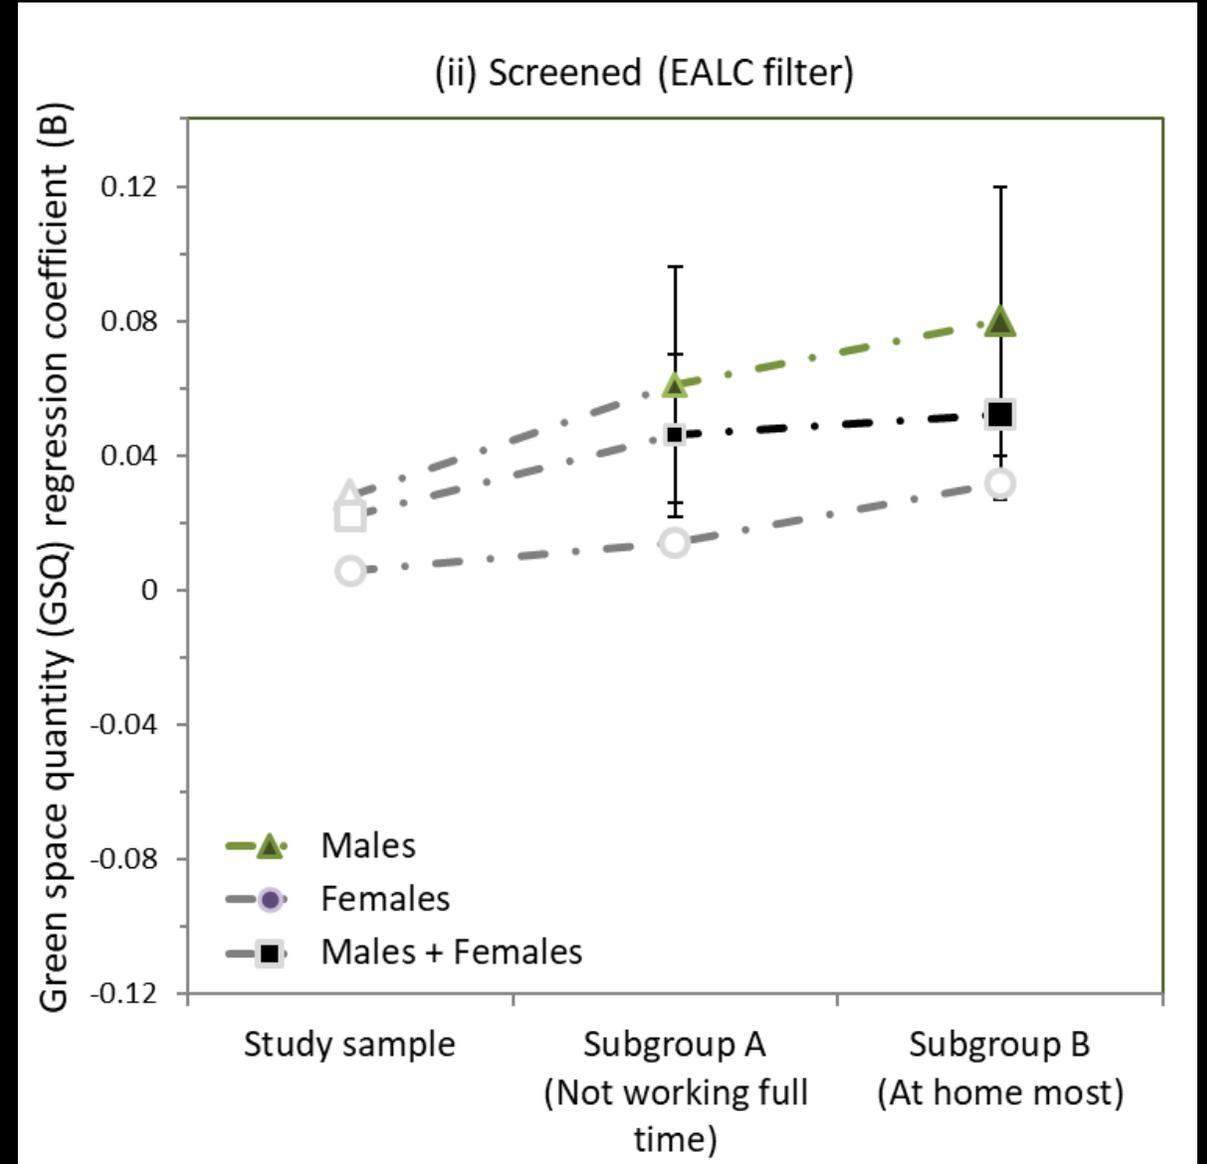

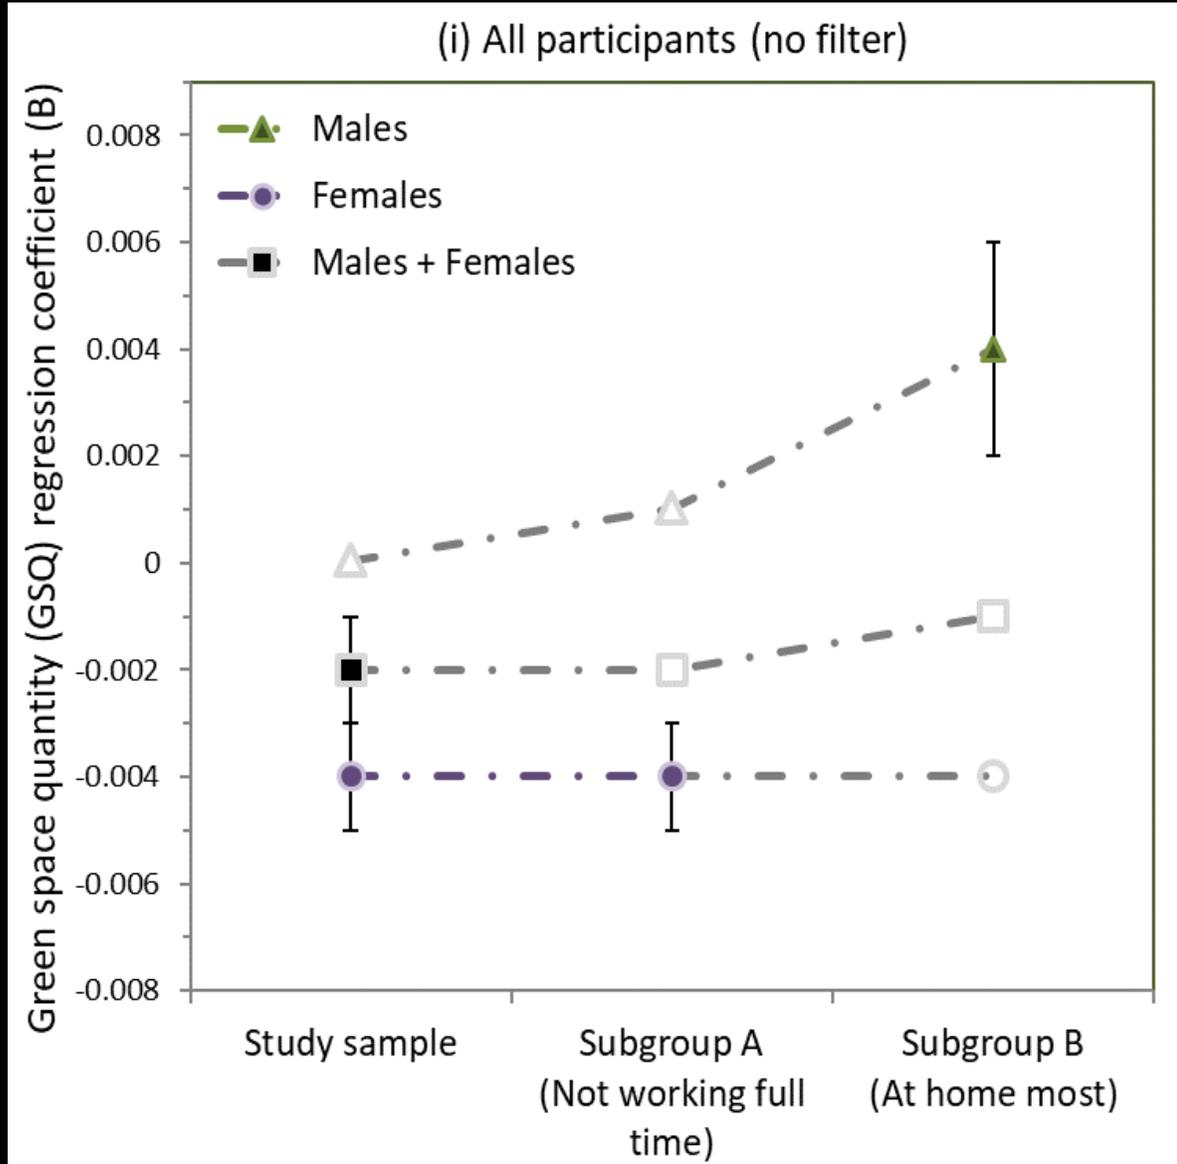

Green space quantity mean = 50% (SD = 14), males = 50%, females = 50%

Perceived stress scale (PSS) – green space quantity relationships

Mental wellbeing (SWEMWBS) – GSQ relationships

Gender differences in relationships

1. Distinct gender differences in relationships between GSQ and mental health outcomes

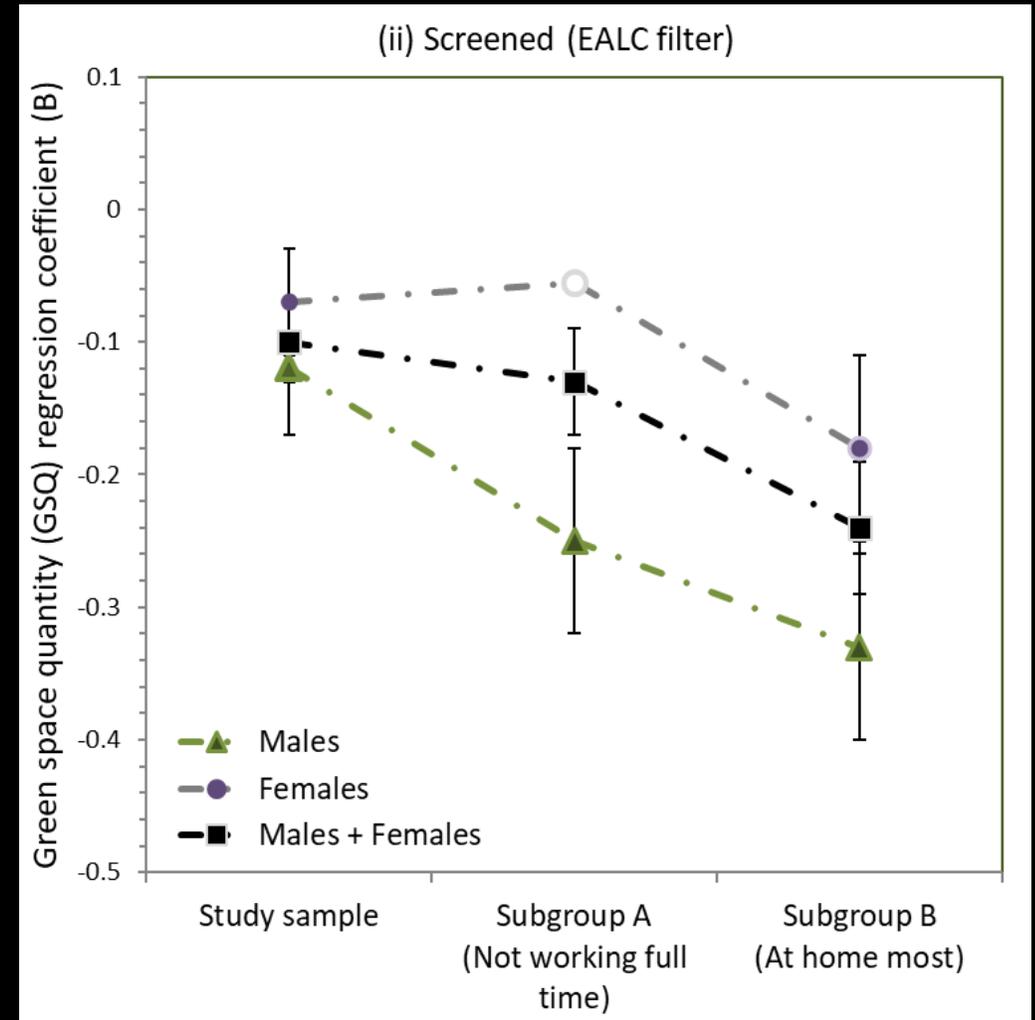

- Consistently positive GSQ effect for MH for males
- More complex for females (+ve and -ve effects)

2. Gender was not a significant moderator of PSS or SWEMWBS

Work status as a proxy for exposure

GSQ effect sizes increased in strength across analysis groups + strongest for Subgroup B ('At home most'), particularly for:

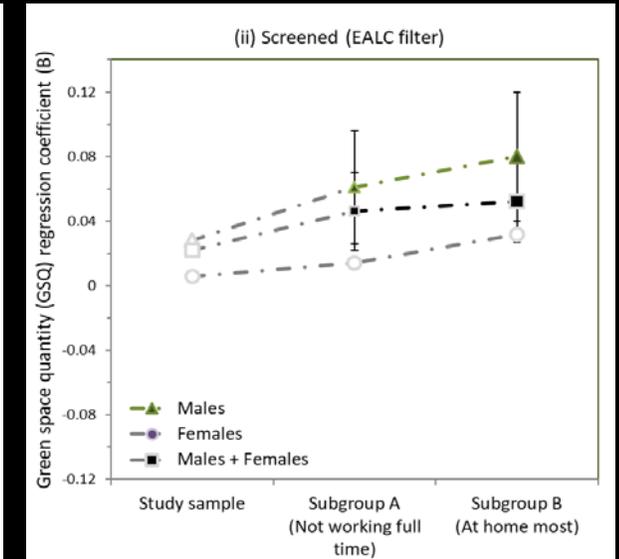

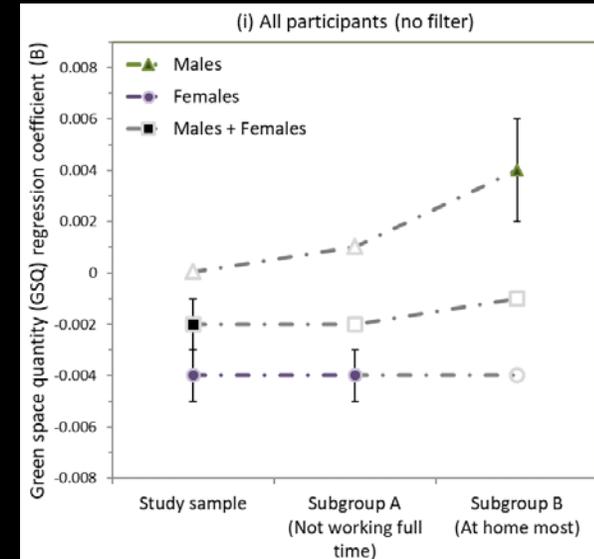

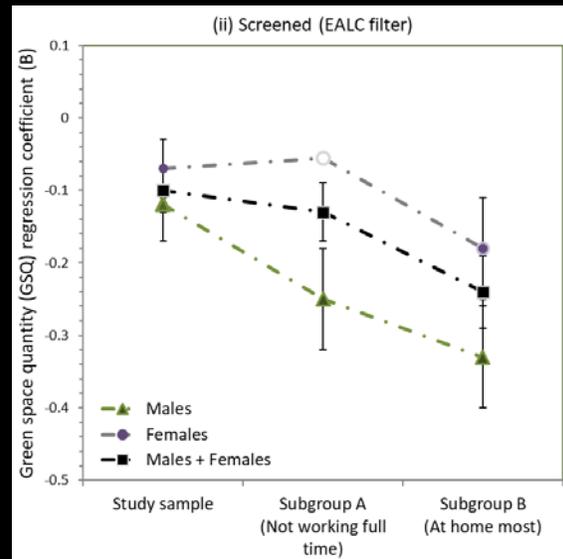

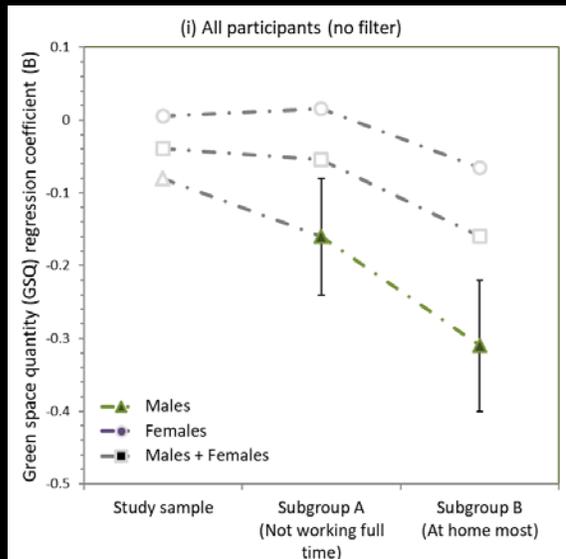

- Males
- Perceived stress

Screening the sample: 'EALC' filter

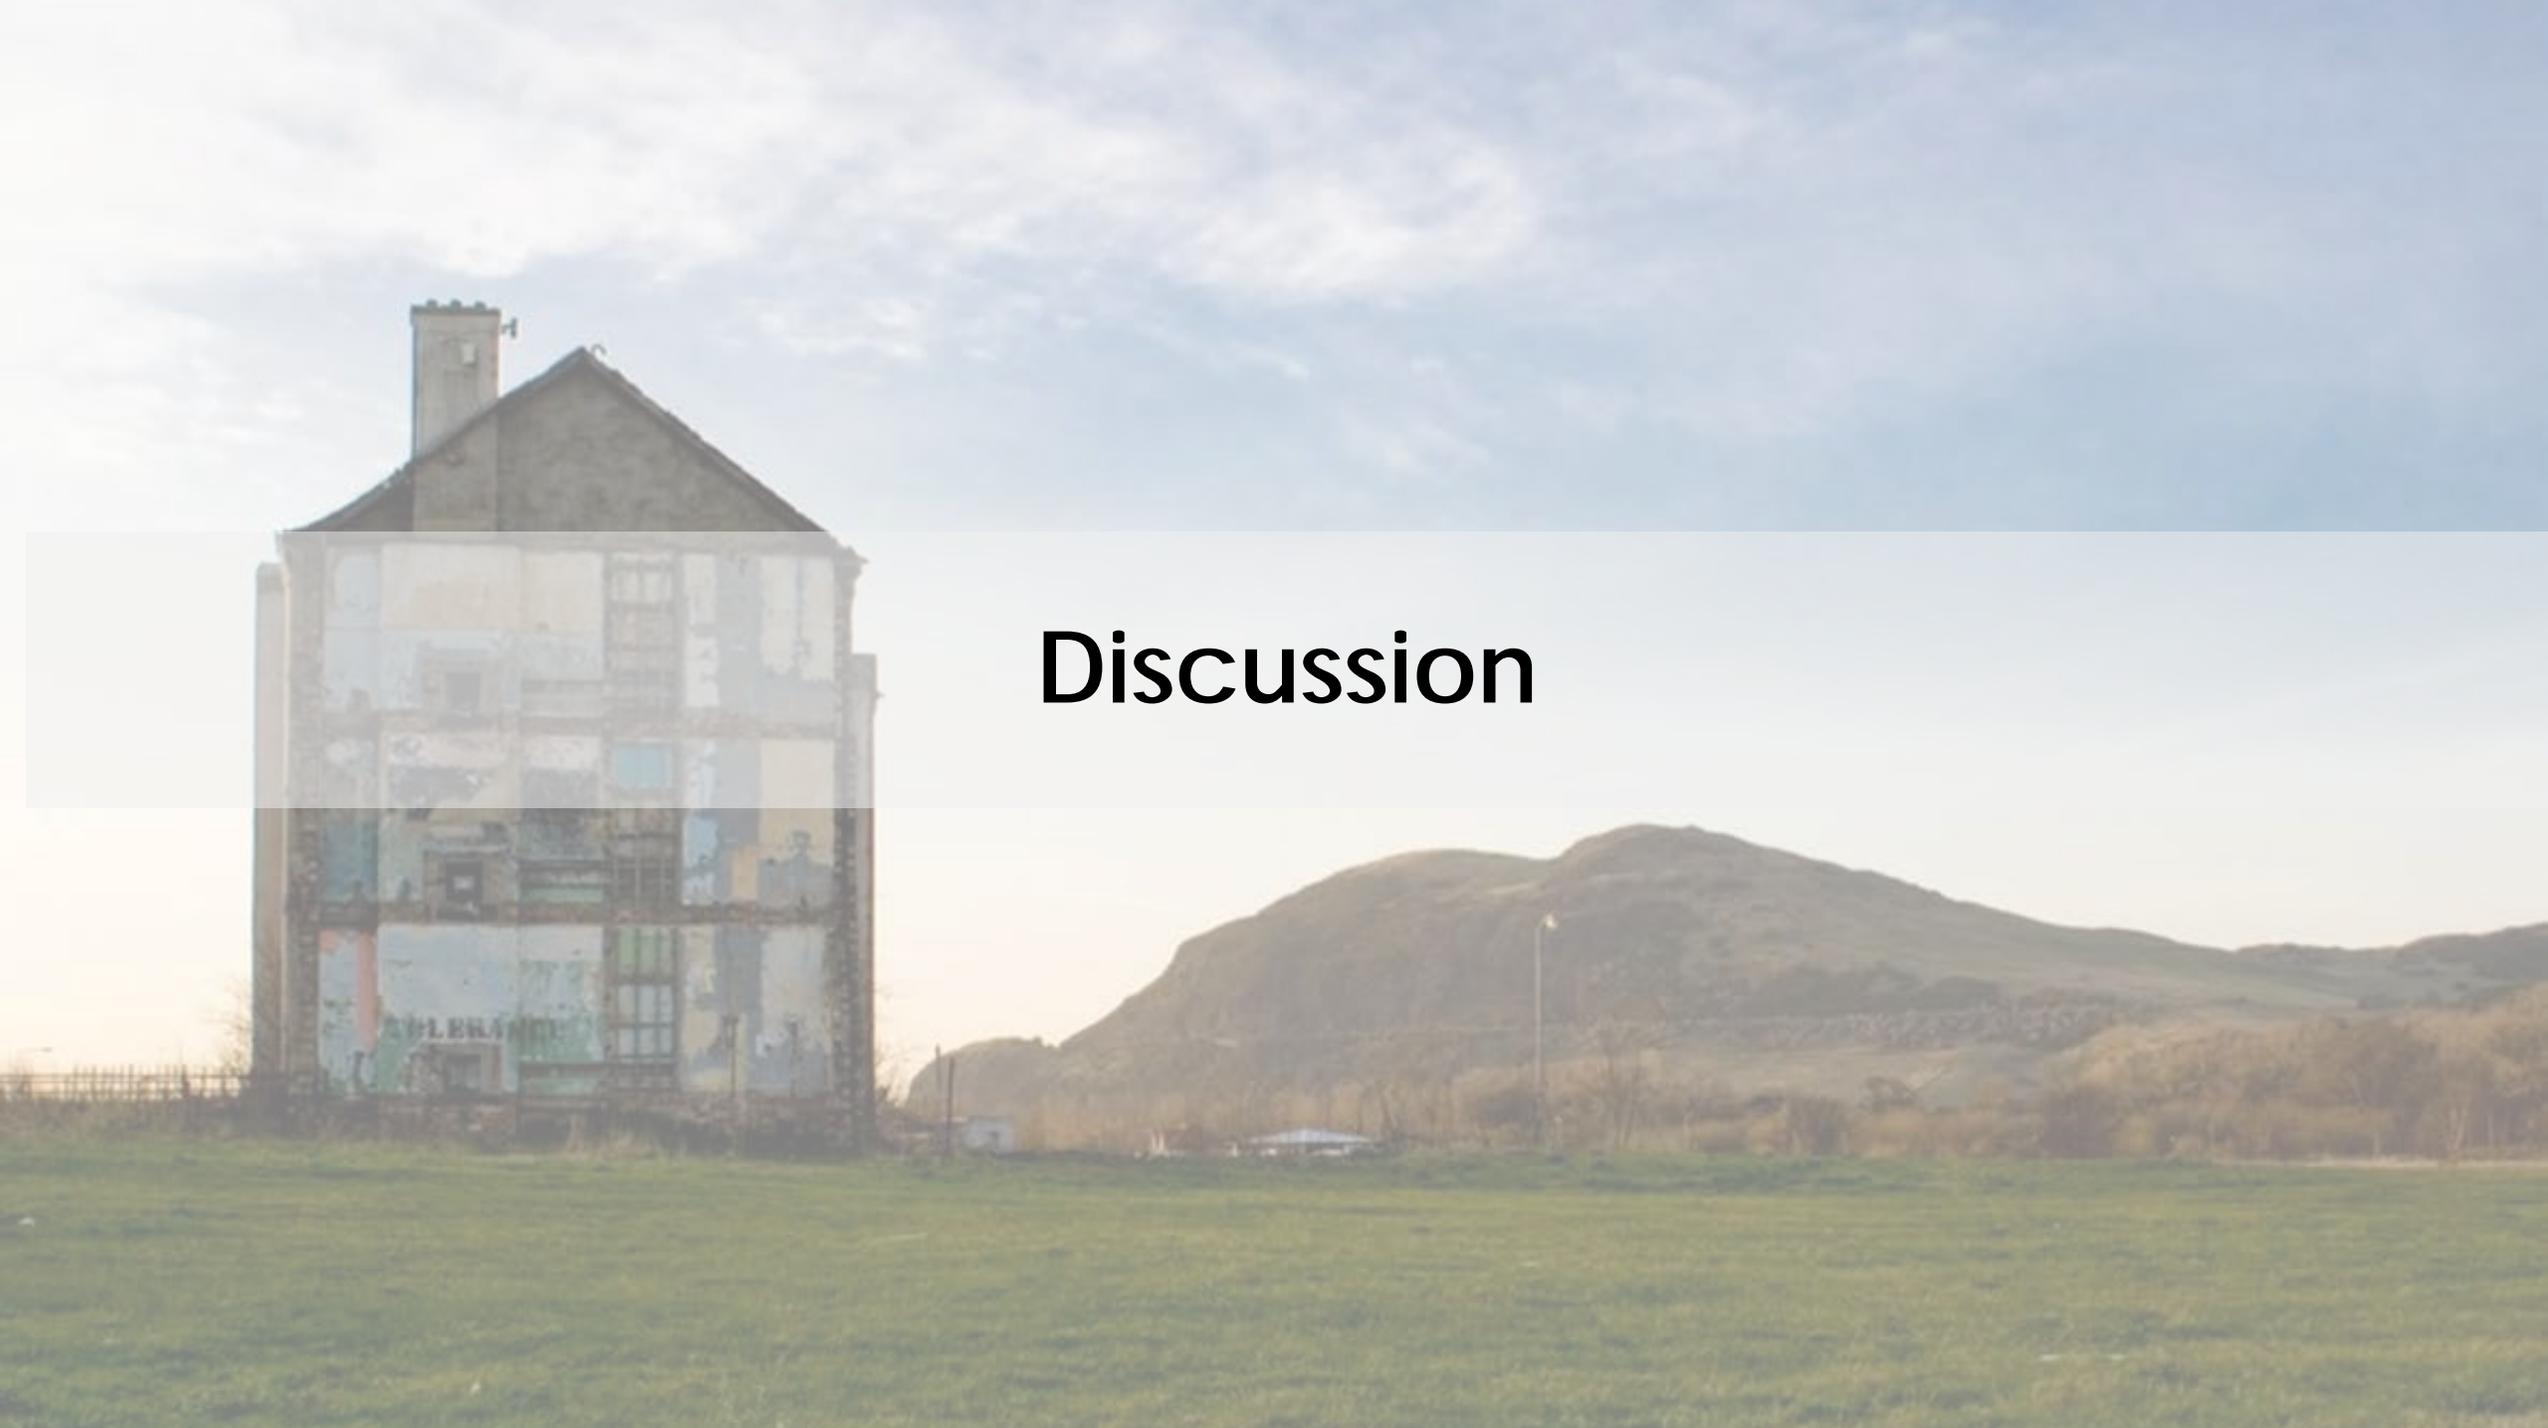

Resulted in:

- greater number of sig. green space quantity (GSQ) effects
- larger GSQ effects for males
- consistent pattern of results between males and females

Other observations

1. Findings broadly consistent between PSS and SWEMWBS
2. Green space quantity accounted for considerably more variance in PSS (3 – 52%) compared to SWEMWBS (3-12%)
3. Physical activity was not a significant predictor of PSS, but was a significant predictor of SWEMWBS (up to 26% variance for males, 8% for females)

Discussion

Discussion

Comparison with other studies: any overall pattern?

Green space metric		Health outcome	Green space effect / re		
			Direction: Better health with more GS?		
			Males	Females	M+F
Quantity / relative amount (%)	300 m buffer	PSS	x	x	x
		PSS, EALC filter	+	+	+
	300 m buffer, Subgroup B	PSS	+	x	x
		PSS, EALC filter	+	+	+
	300 m buffer	SWEMWBS	x	-	-
		SWEMWBS, EALC filter	x	x	x
300 m buffer, Subgroup B	SWEMWBS	+	x	x	
	SWEMWBS, EALC filter	+	x	+	
Quantity / relative amount (%)	UK CAS Ward, binary (43%)	Perceived stress (PSS)	+	+	
	UK CAS Ward, binary 'low' GS group only	Cortisol mean and slope	x	+	
Quantity (")		GHQ-12???? 'Perceived risk of poor health'	+	+	
Quantity (")	1km buffer	DASS (Depression Anxiety Stress Scales)	x	x	
	3km buffer	DASS	-	+	
Quantity (")	UK CAS Ward	GHQ-12 (Mental distress)	+	x (u)	
Proximity (distance)	X (300 m ?) to park, freq users only ()	Depressive symptoms	x	-	
Access (physical and Freq visits)	IS THIS REALLY ACCESS ?	Perceived stress (LS-test)	+	x	
		Mental health and vitality (SF-6)	+	+	
Quantity / relative an UK CAS Ward		Cardiovascular mortality	+	x	
		Respiratory disease mortality	+	x	

Discussion

Comparison with other studies: any overall pattern? **Maybe...**

Methodology recommendations

- routinely stratify analyses by gender
- account for exposure
- screen sample...
- PSS and physical activity
- +++++

Limitations

Work status proxy: crude assumptions around time at home + notable differences in some variables imp. for mental health across analysis subgroups e.g. age, physical activity (*but...*)

Assumes uniform quality of green space (*but limited variation expec.*)

Assumes binary gender (*but sample is small*)

Cross-sectional study – selection effects (*but disadvantaged communities only*)

Conclusions

Conclusions

Relationships between amount of green space in the environment and mental health can differ significantly by gender, in both direction and/or magnitude

Effect sizes for residential green space based on whole study populations may substantially underestimate for gender and other subgroups, such as those with a greater level of exposure (e.g. older people, children)

Conclusions

Work status may serve as a crude but useful proxy for exposure to neighbourhood green space

Methodological handling of data (e.g. treatment of outliers and exceptional cases) can have a significant impact on results and their interpretation

Further research is needed to confirm findings - use existing datasets
