

## SITE ORGANISATION & ZONING

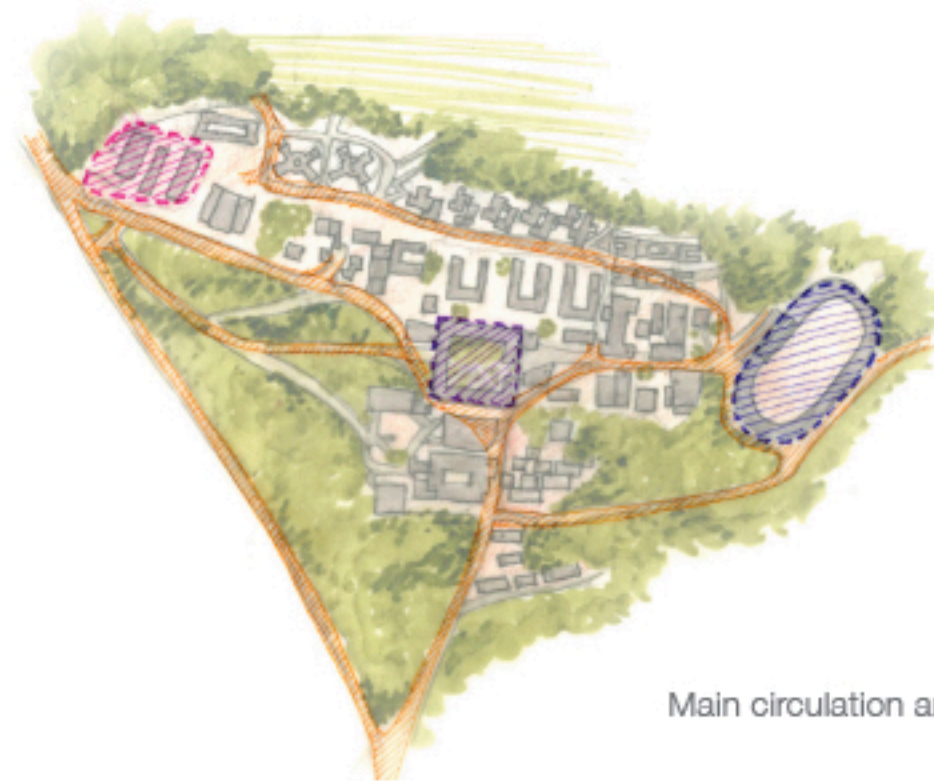

The Huye campus has a strong sense of site organisation and zoning already in existence. Through investigation of the plan of the Huye campus we highlighted possible sites for development.

We have also highlighted green areas which we believe should be retained from a security, and environmental point of view. As Huye has a strong sense of agriculture we believe it is important to maintain a largely vegetated campus.

Trees positively affect the environment, both socially and physically. Trees can have a rejuvenating effect. University of Michigan undertook a study by which participants walked either a main street or an a vegetated pathway by gardens and botanical gardens. The result was outstanding, with those who walked by vegetation daily benefiting from a 20 percent short-term memory than those who walked down a main street.

We highlighted the main routes through the campus as part of the overall organisation of the campus we believe that integrating vegetation and stimulating it into the pathways will lead to a more fruitful campus experience.
