THE ETERNAL(AI)SED
EMBRACE THE SYMBIOSCENE

Context

This project looks into the future of Local Economy as a regenerative process in 2032. Through our research we found that the "Circular Economy" model is a good starting point but we believe this model does not go far enough. We speculate that a "Regenerative Economy" is what is required for the planet and society to survive. For this to become viable, new systems must be designed. One of the key features for Regenerative Society is an increase in Localisation, this is when there is a renewed focus on using and creating what is within your local area, rather than sourcing from all over the world.

To do this, we believe that a redesign of materials and the input of Biofabrication and green chemistry will be heavily relied on in the near future. By defining new roles and ways of communication between local communities within an institutional space.
